# PROGRAMMING USING C

## **WEEK 15 POINTERS**

NAME: JAGADISH S A

**CLASS: AIML B** 

REG NO: 241501071

```
2
     * Complete the 'reverseArray' function below.
 3
 4
     * The function is expected to return an INTEGER_ARRAY.
     * The function accepts INTEGER ARRAY arr as parameter.
5
 6
 7
8 ,
9
     \ensuremath{^{*}} To return the integer array from the function, you should:
10
           - Store the size of the array to be returned in the result_count variable
11
           - Allocate the array statically or dynamically
12
13
     * For example,
14 •
     * int* return_integer_array_using_static_allocation(int* result_count) {
15
           *result count = 5;
16
17
           static int a[5] = {1, 2, 3, 4, 5};
18
19
           return a;
20
21
     * int* return integer array using dynamic allocation(int* result count) {
22 4
23
           *result count = 5;
24
           int *a = malloc(5 * sizeof(int));
25
26
           for (int i = 0; i < 5; i++) {
27
28
               *(a + i) = i + 1;
29
30
31
           return a;
32
33
34
    int* reverseArray(int arr_count, int *arr, int *result_count) {
35 v
        *result_count=arr_count;
36
        int *result=(int *)malloc(arr_count*sizeof(int));
37
38 (
        for(int i=0;i<arr_count;i++){</pre>
            result[i]=arr[arr_count-1-i];
39
40
41
        return result;
42
43
44
```

|   | Test  | Expected | Got |   |  |  |
|---|---|----------|-----|---|--|--|
| ~ | int arr[] = {1, 3, 2, 4, 5};                                      | 5        | 5   | ~ |  |  |
|   | int result_count;   | 4        | 4   |   |  |  |
|   | <pre>int* result = reverseArray(5, arr, &amp;result_count);</pre> | 2        | 2   |   |  |  |
|   | for (int i = 0; i < result_count; i++)                            | 3        | 3   |   |  |  |
|   | <pre>printf("%d\n", *(result + i));</pre>                         | 1        | 1   |   |  |  |

Passed all tests! <

An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of *minLength* or more, and it can only make one cut at a time. Given the array *lengths[]* representing the desired lengths of each segment, determine if it is possible to make the necessary cuts using this machine. The rod is marked into lengths already, in the order given.

#### Example

```
n = 3

lengths = [4, 3, 2]

minLength = 7
```

The rod is initially sum(lengths) = 4 + 3 + 2 = 9 units long. First cut off the segment of length 4 + 3 = 7 leaving a rod 9 - 7 = 2. Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater than or equal to minLength = 7, the final cut can be made. Return "Possible".

#### Example

```
n = 3

lengths = [4, 2, 3]

minLength = 7
```

The rod is initially sum(lengths) = 4 + 2 + 3 = 9 units long. In this case, the initial cut can be of length 4 or 4 + 2 = 6. Regardless of the length of the first cut, the remaining piece will be shorter than minLength. Because n - 1 = 2 cuts cannot be made, the answer is "Impossible".

#### **Function Description**

Complete the function cutThemAll in the editor below.

cutThemAll has the following parameter(s):

int lengths[n]: the lengths of the segments, in order

#### **Input Format For Custom Testing**

The first line contains an integer, n, the number of elements in *lengths*.

Each line i of the n subsequent lines (where  $0 \le i < n$ ) contains an integer, lengths[i].

The next line contains an integer, minLength, the minimum length accepted by the machine.

#### Sample Case 0

### Sample Input For Custom Testing

```
STDIN Function
-----
4 → lengths[] size n = 4
3 → lengths[] = [3, 5, 4, 3]
5
4
3
9 → minLength= 9
```

#### Sample Output

Possible

#### Explanation

The uncut rod is 3 + 5 + 4 + 3 = 15 units long. Cut the rod into lengths of 3 + 5 + 4 = 12 and 3. Then cut the 12 unit piece into lengths 3 and 5 + 4 = 9. The remaining segment is 5 + 4 = 9 units and that is long enough to make the final cut.

```
1 ,
2
     * Complete the 'cutThemAll' function below.
 3
     * The function is expected to return a STRING.
 4
     * The function accepts following parameters:
     * 1. LONG_INTEGER_ARRAY lengths
6
     * 2. LONG INTEGER minLength
7
8
9
10 •
11
     * To return the string from the function, you should either do static allocation or dynamic allocation
12
     * For example,
13
14 •
     * char* return string using static allocation() {
           static char s[] = "static allocation of string";
15
16
17
           return s;
     * }
18
19
20 v
     * char* return string using dynamic allocation() {
           char* s = malloc(100 * sizeof(char));
21
22
           s = "dynamic allocation of string";
23
24
25
           return s;
     * }
26
27
     */
28
29 | char* cutThemAll(int lengths_count, long *lengths, long minLength) {
30
        int s=0;
        for(int i=0;i<lengths_count-1;i++){</pre>
31 v
32
            s+=*(lengths+i);
33
34 •
        if(s>=minLength){
35
            return "Possible";
36
37 •
        else{
            return "Impossible";
38
39
40
41
42
```

|          | Test  | Expected   | Got        |          |
|----------|---|------------|------------|----------|
| <b>~</b> | <pre>long lengths[] = {3, 5, 4, 3}; printf("%s", cutThemAll(4, lengths, 9))</pre> | Possible   | Possible   | <b>~</b> |
| <b>~</b> | <pre>long lengths[] = {5, 6, 2}; printf("%s", cutThemAll(3, lengths, 12))</pre>   | Impossible | Impossible | <b>~</b> |

Passed all tests! 🗸
